Unit 3 / Lesson 5 / Project 3

Extending the blog test suite

Estimated Time: 2-3 hours

In this assignment you are going to use what you learned in the previous two assignments to implement further tests for the blog application. Again this assignment isn't going to be prescriptive about which tests you should write; you should try to use everything you have learned about testing so far to produce an application which has a suitable level of test coverage.

To help you get started try to draw up a list of which features and parts of the codebase you think need testing. Then think about which style of testing would be most appropriate to check that each element of your code is working correctly. You can discuss this with your mentor if you are struggling with where to start.

When you have your list of tests finalized then try to implement them one-by-one, slowly building up a test suite for the blog. As always make sure to discuss your finished code with your mentor, and push your code up to GitHub on a regular basis.
